Determining the health of the brain. A powerful magnetic field. It is useful in going through the body using radio waves and creating “slice” images. Parts of the face including eye sockets (frontal), nasals (nasal), and nasal bones are seen at lower right. Inside the skull the cerebrum of the head of a 31-year-old woman, taken from the back of the head (top left) through to the front (lower right). There are 20 scans, with the cerebellum (pink) beneath it, as well as tissues of the neck (blue) seen. MRI scanning creates “slice” images through the body using radio waves and a powerful magnetic field. It is useful in determining the health of the brain.
